NOTE:

Criteria for the diagnosis of diabetes (ADA)

FBS ≥ 126 mg/dL. Fasting is defined as no caloric intake for at least 8 h **OR**
2-h PPBS ≥ 200 mg/dL during an OGTT performed using a glucose load containing the equivalent of 75 g anhydrous glucose dissolved in water **OR**
HBA1C $\geq 6.5\%$ **OR**
RBS ≥ 200 mg/dl In a patient with classic symptoms of hyperglycemia or hyperglycemic crisis.

Categories of increased risk for diabetes (prediabetes) (ADA)

FBS 100 mg/dL -125 mg/dL **OR**
2-h PPBS 140 mg/dL -199 mg/dL **OR**
HBA1C 5.7–6.4%

15 – 20 years	0.80 – 2.10	5 -10 Yrs	6.4 - 13.3		
PREGNANCY				PREGNANCY	
1st Trimester	0.81 -1.90			1st Trimester	0.1 – 2.5
2nd& 3rd Trimester	1.00 – 2.60			2nd Trimester	0.2 – 3.0
				3rd Trimester	0.3 – 3.0

LIMITATIONS : T3 and T4 circulates in reversibly bound form with Thyroid binding globulins (TBG), and to a lesser extent albumin and Thyroid binding Pre Albumin, so conditions in which TBG and protein levels alter such as pregnancy, excess estrogens, androgens, steroids may falsely affect the T3 and T4 levels. Normal levels of T4 can also be seen in Hyperthyroid patients with T3 Thyrotoxicosis, hypoproteinemia or ingestion of certain drugs. Serum T4 levels in neonates and infants are higher than values in the normal adult, due to the increased concentration of TBG in neonate serum. TSH may be normal in central hypothyroidism, recent rapid correction of hyperthyroidism or hypothyroidism, pregnancy, phenytoin therapy. Autoimmune disorders may produce spurious results. Various drugs can interfere with the test result. TSH has a diurnal rhythm so values may vary if sample collection is done at different times of the day.
